

Fance Franck:

Pure Geometry, Natural Grace

Pucker Gallery, Boston

Through her porcelains Fance Franck exhibits an all encompassing fusion of cultures, academic disciplines and art forms. Having studied the language arts and philosophy extensively between La Sorbonne and Harvard, as well as studying the physical arts in New York, Paris and Japan, she has a complete understanding of her materials, techniques, historical background and influences, as well as a learned curiosity and creativity. An interdisciplinary aura surrounds the pottery of Fance Franck. One sees in her porcelains the esthetic beauty and respect for nature found in Far-Eastern culture, the elegance perpetuated in centuries of refined porcelains and the pure geometric beauty of nature's shapes. One is awed by the beauty of her pottery in the same way that one can be mystified by the precise geometry of a snowflake.

Geometry is the study of properties, relationships and measurements of regular curves, angles, surfaces and solids. There is an innate sophistication in the porcelains of Fance Franck; a knowledgeable, calculated beauty which calls to mind the precise mathematics inherent to the geometry of nature. Franck's porcelains are composed of perfect shapes and decorated with seemingly calculated designs of vectors, arcs and trigonometric fluctuations already inherent within the shapes. A fluid yet solid line arcs across the body of an otherwise perfect, small oval vase (PG119), defining the ellipse within the circle.

There is a significant, exact, formulaic beauty in the geometry of a large, oval vase in smoky green (PG103). Franck transforms the elliptical opening into the creamy head of a flower with a symmetrical rhythm of lines that evokes a petal's shape. The rotund edges of the vase are defined with flawless arcs.

"Little Clown" (PG130), is an homage to the circle. The small bottle itself echoes the perfect shape, while burnt sienna circles repeat around the form to the precise  $\pi r^2$  opening. The flat oval vase in brown and black glaze (PG108) is a variation on one of Franck's elegant, signature shapes. By curving the rectangular shoulders with elliptical incisions and allowing the brown glaze to push through the black, she highlights the ambiguity between rectangle and oval.

Glaze always unites with shape in Franck's pottery. Her knowledge and mastery as a student of Japanese glazes abounds in the creamy celadons, abyssal blacks and copper reds which make up this body of work. Delicate underglaze decorations

of opaque rose leaves or translucent iron horses overlap and trample one another as they race around a perfectly proportional, squared, oval vase (PG105). The porcelain body often seeps through to highlight an edge, while other times the earthy tones are allowed to pool and therefore darken as in an elegant stemmed bowl (PG122). The perfect, circular edge of the bowl lifts from its celadon perch, while the pool of rich blue-black glaze inside the bowl creates a deep black hole. Often, a splash of glaze serves to off-set a well defined shape, calling attention to the pure form by opposing it as in a small oval vase in black glaze (PG115).

One can not ignore the extensive knowledge of methods and materials that are the solid foundation on which these porcelains are created. Franck's pottery exudes scientific formulas, geometric equations and perfect shapes but in an uncomplicated way. One does not imagine her compass in hand, drafting forms in clay. Her knowledge is such that it simply happens. Franck creates a pure beauty in clay by combining this science with the creative, spiritual energy of poetry and the inquisitive nature of philosophy, all of which are her personal make-up.

Pottery, poetry, and nature have an elemental connection. Poetry has a cadence, an often mathematical rhythm of syllables. A sonnet is fourteen lines of iambic pentameter, but one reads and hears the melody and meaning in the words not the calculated structure of the poem. The natural world abounds in geometric shapes and repetitions. The interior spiral of a conch shell decreases in a perfect ratio. The act of doing ceramics requires a working knowledge of science, earth, and creativity. It consists of a mutual relationship between science and art, between control and release, between surety, guaranteed knowledge and experimentation. There results a wonder and satisfaction when looking at the pottery of Fance Franck, much like having the ability to understand and calculate a mathematical formula or prove a theorem. There is serenity in simply having that knowledge.
